

Uniform Water Application for Corners

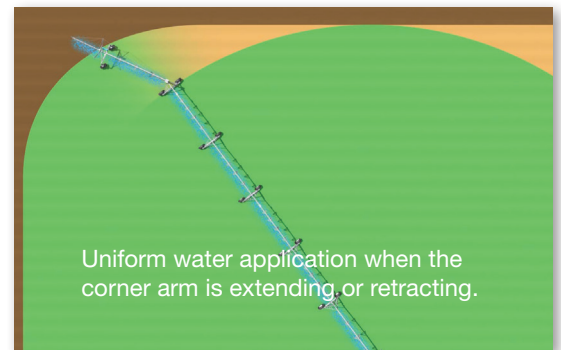

EnCompass™ from Valley® Gives You Intelligent Water Uniformity

Under-Watered Over-Watered

Corner arms were a big step forward in center pivot technology, allowing you to irrigate 14% more acres, with additional yield potential putting an extra \$10,000-\$15,000 in your pocket. But not all corner arms are created equal. Inaccurate nozzle controls can lead to both over- and under-watering when the corner arm is extending or retracting.

EnCompass is the next level in accurate application, with intelligent water uniformity that automatically adjusts as the corner is moving.

*Based upon an average 1/4-mile machine for corn/soybeans.

 Durability/Reliability

Uniform Water Application for Corners

Unparalleled Water Application

As the leader in center pivot technology, Valley helps you conserve water, produce greater yields and increase profitability. EnCompass is water application made smarter.

- Uniform application
 - GPS data automatically adjusts corner nozzle control in real time.
 - Corner arm nozzles pulse on and off, providing the exact flow needed.
- Automatic application adjustments for any field
 - Operate in a leading or trailing position, allowing for superior application uniformity in any direction or around any obstacle
 - Apply water evenly across the field.
- Bring your entire field into production and maximize yield.
- Simple to operate
- Works on new and existing Valley corner machines.
- Two valve choices
 - Allows EnCompass to work with any type of water source.
